

Mazda celebrates 50 million vehicles made in Japan

- Company started production of the three-wheeled truck in October 1931
- This fiscal year, Mazda aims to sell 1,660,000 vehicles globally

Hiroshima / Leverkusen, 29. May 2018. Mazda Motor Corporation has announced that cumulative production in Japan reached 50 million units on May 15. The company held a commemorative ceremony today at its Hofu Plant in Yamaguchi prefecture. Representative Director, President and CEO Masamichi Kogai, executive officers and union representatives were in attendance. The 50 million-unit milestone was achieved 86 years and seven months after Mazda produced its first three-wheeled truck in October 1931.

“Mazda began making cars 86 years ago, and now we’ve reached 50 million units of production in Japan. Even making 1 million cars a year, it would take 50 years to reach this milestone, showing just how long Mazda’s history is,” said Kogai at the ceremony. “Moving forward, Mazda will continue to build a strong brand through a variety of initiatives. Our plants in Hofu and Hiroshima will continue to evolve and act as parent factories, rapidly deploying their technologies and skills to our overseas plants. I’d like us all to work together to ensure these plants continue to embody the kind of technical prowess that does justice to Japan’s proud history of Monotsukuri.”

Mazda began its journey as an automaker in 1931, when it started producing three-wheeled trucks in Hiroshima. In 1960 it commenced production of the R360 Coupe micro-mini, marking a bold entry into the passenger car market. Vehicle manufacture started at Hofu Plant in Yamaguchi in 1982, and domestic production duties have since been shared between the Hofu and Hiroshima Plants. The production techniques and flexible production systems developed at these plants have helped Mazda to grow its business. Mixed production lines capable of producing different models on a single line enable manufacture of multiple models at low volumes, a breakthrough in the traditional tradeoff between product variety and competitiveness and volume efficiency. In 2016 and 2017, the company took steps to increase its production flexibility for crossover models and create a framework capable of responding quickly to changes in demand. The domestic plants take the lead with Mazda’s global car-making; production techniques and technologies established in Japan are then rolled out to overseas facilities.

Mazda aims to sell 1,660,000 cars this fiscal year, the final year of its Structural Reform Stage 2 medium-term business plan, and plans to establish a global production framework capable of manufacturing two million units annually by fiscal year ending March 2024. Mass-production of vehicles featuring next-generation technologies and design is slated to start in 2019, and the company will continue expanding its production framework in an effort to get cars to customers as quickly as possible.

Aspiring to create a world in which cars can co-exist sustainably with people, society and the earth, Mazda will continue to enrich people’s lives through various touch points, including the manufacture of high-quality cars, and become a brand with which customers feel a strong emotional bond.
